Dear Elected Official,

CONSIDER THIS: THC, the high-inducing chemical in marijuana, is hidden in an array of deceptively different products. In states where pot is legal, you can consume THC in tea, honey, sugar, water and coffee, to name just a few of the products available.

This hidden marijuana is dangerous to kids and confusing to parents who want to protect their children. Parents and teachers find it difficult to spot today's pot, which also comes in forms that can be vaped and in delivery methods designed to reach the bloodstream faster and deliver a quicker high, including eye drops, nasal sprays and inhalers.

Dear Elected Official,

Are you surprised these are marijuana products and not heroin, opioids and cocaine?

This is the new generation of products sold in states that have legalized recreational marijuana. Marijuana has expanded beyond a plant to include highly processed, highly-potent forms including edibles, powders, and concentrates for vaping and dabbing.

The trend in commercial markets is toward distilled THC, the high-inducing chemical in marijuana that alters perception and mood. THC potency has increased dramatically since the 1990s, from an average of 3.8% for weed to an average of 68.6% THC for concentrates sold in legal states today.

Dear Elected Official,

CONSIDER THIS: THC, the high-inducing chemical in marijuana, is hidden in an array of deceptively different products available in the recreational pot markets including eye drops, nasal sprays, suppositories and inhalers. For kids, they're easy to conceal. For parents and teachers, they're hard to spot.

Please ban THC products in the recreational marijuana market that resemble medicine and send the misleading message that these products are safe and healthy for kids.
